

Telnet

Telnet command is used to verify connection to an IP Address Port.

For example, to verify connection to 192.168.0.10 on port 25, issue the command:

```
telnet 192.168.0.10 25
```

If the connection succeeds, a blank screen will show up, meaning that the computer port is open.

A failed connection will be accompanied by an error message. It can indicate either a closed port or the fact that the indicated remote server is not listening on the provided port.

MS Windows 10: Enabling the Telnet Client

- Firstly you need to enable the telnet client, if you don't enable it you'll get a result similar to the below message when trying to use it.
C:\>telnet google.com 80
'telnet' is not recognized as an internal or external command, operable program or batch file.
C:\>
- You can enable the client either by command line or through the graphical interface.

Enabling the telnet client through command line

- Run the below command in command prompt with administrator permissions.
dism /online /Enable-Feature /FeatureName:TelnetClient
- That's it, after a few seconds telnet should be ready to use.

Enabling the telnet client through the graphical user interface

- Click the start button, then start typing "Turn Windows features on or off", and select this option, as shown below.

2. The “Turn Windows Features on or off” window should open, scroll down and select “Telnet Client”.

3. Click the OK button to proceed, this will display a screen while the changes apply.

4. When complete it will display as below, you can now close the window.

Verifying that the telnet client is enabled

- Simply open command prompt or powershell, type 'telnet' and press enter. If this was successful you should have a prompt similar to the below:
- Welcome to Microsoft Telnet Client
- Escape Character is 'CTRL+]'
- Microsoft Telnet>
